

Network Security Service

Most companies in the world conduct business by leveraging the power of the internet, although internet brings great benefits to any organisation, it can also cause harm if proper security measures are not taken to combat the multitude of threats that exists on the global network. An unsecure or improperly implemented network security can leave an organisation venerable to attacks, which could lead to exploitation of critical organisational information and loss of communication.

Along with external internet security, internal security must also be clearly planned and deployed. Internal security protects an organisation by limiting who can access organisational data and how much control they have over that data. Regardless of your needs Layer One can help you protect your organisation with a combination of hardware and software based security systems.

Our Solution

Our extensively qualified engineers adopt an innovative approach to network design that uses hardware and software to address threats at all levels, allowing our security solutions to combat even the most sophisticated threats. We will protect your network by creating a secure and comprehensive business platform that can integrate with current and future technologies. Formulate, implement and maintain effective security policies, processes and procedures, preventing downtime from external threats allowing you to optimise your network's performance.

We will simplify the management of your network security, enabling you to selectively outsource the secure hosting and proactive monitoring of your network, enabling you to maintain your customer relationships by ensuring that your on-line and mission critical services are always available to them.
